

Casey Bladow
CSIS 360 - Spring 2015
Assignment 9 - 25 points
Due Tuesday, April 14

Follow the [Creating Assignments](#) handout while performing the below steps. The purpose of this assignment is to ...

If any of you find that I am misusing or have incorrect terminology in any of my descriptions, please drop me a note with an explanation. I'm learning too!

1. *rsync* is an important backup utility for Linux systems. Unfortunately, it is not covered in the textbook. Learn about the *rsync* utility through the following articles while at the keyboard experimenting with the commands. The articles refer to using the option *-e ssh* so that *ssh* is used as the protocol, but *ssh* is used by default (<http://www.rsync.net/resources/faq.html> <-- you don't need to read this, it's just where I found the information).
 - <http://www.thegeekstuff.com/2010/09/rsync-command-examples/>
 - <http://www.tecmint.com/rsync-local-remote-file-synchronization-commands/>
 - <https://www.digitalocean.com/community/tutorials/how-to-use-rsync-to-sync-local-and-remote-directories-on-a-vps>
 - Once you have learned about *rsync* from the above articles, perform the following.
 - For convenience open two terminal windows, one for your Ubuntu box and log into *smaug* using *ssh* in the other.
 - Create a directory on your Ubuntu box called *assign9*. Within the *assign9* directory, create a directory called *ubuntuDir* that contains the files *file1*, *file2*, through *file50* (the 3rd article shows you a convenient shortcut).
 - Using *rsync*, copy the *assign9* directory (which should include *ubuntuDir* and the 50 files in it) from your Ubuntu box up to your *smaug* account. Immediately repeat the successful command (up arrow) to note that nothing is transferred the second time as nothing has changed.
 - On your *smaug* account, verify that the files were successfully transferred. Then on *smaug*, delete *file30* and *touch file40*. Repeat the *rsync* command on your Ubuntu box, which should upload only *file30* and *file40*.
 - On your Ubuntu box, delete files *file11* through *file15*, touch files *file21* through *file25* then give the *rsync* command from your Ubuntu box to update the files on *smaug*, including deleting the

files deleted from your Ubuntu box (did you read the above articles?). ***Do a window grab of the terminal window showing the command you issued on your Ubuntu box and include it in your assignment 9 document.***

```
bladowca@ubuntu:~/assign9/ubuntuDir$ rsync -azv --delete ~/assign9 cg0546wq@smaug.mnstate.edu:~
cg0546wq@smaug.mnstate.edu's password:
sending incremental file list
deleting assign9/ubuntuDir/file15
deleting assign9/ubuntuDir/file14
deleting assign9/ubuntuDir/file13
deleting assign9/ubuntuDir/file12
deleting assign9/ubuntuDir/file11

sent 504 bytes  received 161 bytes  147.78 bytes/sec
total size is 0  speedup is 0.00
bladowca@ubuntu:~/assign9/ubuntuDir$ █
```

- Create a directory on your smaug account called *smaugDir* in the *assign9* directory that contains the files *fileA*, *fileB*, through *fileZ*.
- Using *rsync* from your Ubuntu box, copy the *assign9* directory from *smaug* that contains the *ubuntuDir* and the *smaugDir* directory on *smaug* down to your Ubuntu box. Immediately repeat the successful command (up arrow) to note that nothing is transferred the second time as nothing has changed. Do an *ls* command on your Ubuntu box from the appropriate directory to verify the successful transfer of the directory, then ***do a window grab of the terminal window showing the files now on your Ubuntu box and include it in your assignment 9 document.***

```
smaugDir: bash - Konsole
File Edit View Bookmarks Settings Help
assign9 ubuntuDir
bladowca@ubuntu:~/assign9$ rm assign9
rm: cannot remove 'assign9': Is a directory
bladowca@ubuntu:~/assign9$ rsync -avz cg0546wq@smaug.mnstate.edu:~/assign9 ~/
cg0546wq@smaug.mnstate.edu's password:

fileB fileD fileF fileH fileJ fileL fileN fileP fileR fileT fileV fileX fileZ
bladowca@ubuntu:~/assign9/smaugDir$
```

- NOTE: KEEP THE assign9 DIRECTORY AS IT WILL BE USED IN A FUTURE ASSIGNMENT!
- *Include answers for the following in your assignment 9 document.*
 - *What do the following rsync options mean*
 - -v verbose
 - -r indicates recursive
 - -a archive mode
 - -z enable compression

- **-h** human-readable, output numbers in a human-readable format
- **-n** dry run (simulation)
- **--delete** deletes files that are not there in source directory
- **--include** allows you to include files or directories while doing synchronization
- **--exclude** allows you to exclude files or directories while doing synchronization
- ***what's the difference between using a slash following a directory, for example dir vs. dir/?*** Different results...

without the trailing slash...

```
rsync -avz 192.168.200.10:/tmp/dir .
```

would produce

dir/file01

dir/file02

whereas including the trailing slash...

```
rsync -avz 192.168.200.10:/tmp/dir/ .
```

would produce

file01

file02

2. Read chapter 7 (The Shell) while at the keyboard experimenting with the commands as you read the chapter. ***Answer the following questions in your assignment 9 document (yes, there's quite a long list, keep these in mind for the final test)***
 - ***When issuing commands to execute utilities, what are "options?" Give a couple examples and what the options would do.***

An option is an argument that modifies the effects of a command.

--help generates a usage message

-r causes the ls utility to display the list of files in reverse alphabetical order.

- ***What is the -h option?***

Display readable file sizes

- ***What do the following control characters do on a command line?***
cntl-u to kill a line
cntl-w to erase a word
cntl-h to erase a character
- ***What option can you give with a command to get help on the command?*** --help
- ***What command will temporarily add the working directory to PATH? (remember when you had to type ./a.out instead of just a.out?)***
PATH=\$PATH:.
- ***How can you redirect input to a program so that the input comes from a file?*** Command [arguments] < filename
- ***How can you redirect output from a program so that the output goes to a file?*** >
- ***How can you redirect output from a program so that the output is appended to a file?*** >>
- ***Give a good description of a filter and how it's used.*** A filter is a command that process an input stream of data to produce an output stream of data. A command line that includes a filter uses a pipe to connect standard output of one command to the filter's standard input.
- ***What is /dev/null?*** /dev/null is a data sink or bit bucket
- ***What suspends a running job?*** CONTROL-Z
- ***What command would send the directory listing to the line printer?*** lpr
- ***What is the noclobber feature of the shell?*** Prevents overwriting a file using redirection.
- ***What is an ambiguous file reference?*** Filenames that contain special characters because they do not refer to any one specific file.
- ***What is globbing?*** The process that the shell performs on these filenames.
- ***What is a PID?*** Process identification number – a large number assigned by the operating system.
- ***What does it mean when a utility is a builtin?*** A builtin is a command that is built into a shell.
- ***What do the following utilities do?***

- *fg* Moves a process to the foreground
- *bg* Moves a process to the background
- *kill* Aborts a background job
- *tr* Maps one string of characters to another
- *tee* Sends standard input of both a file and standard output
- *jobs* Displays a list of suspended jobs and jobs running in the background
- *What do the following special characters do or what are they for?*
 - *&* run a command in the background
 - *?* generate filenames
 - *** performs a function similar to the question mark but matches any number of characters in a filename
 - *|* The symbol for a pipe
 - *[]* causes the shell to match filenames containing the individual characters.

3. *What did you think of this assignment? How long did it take you? Do you have any suggestions for the next time I teach this class?* Wasn't bad. Easy to follow through. Only took a few hours
4. *What did you learn from this assignment?* rsync is a nice utility to keep things synced up from a home system to one that is not (i.e. my laptop and smaug).
